

1.Design log

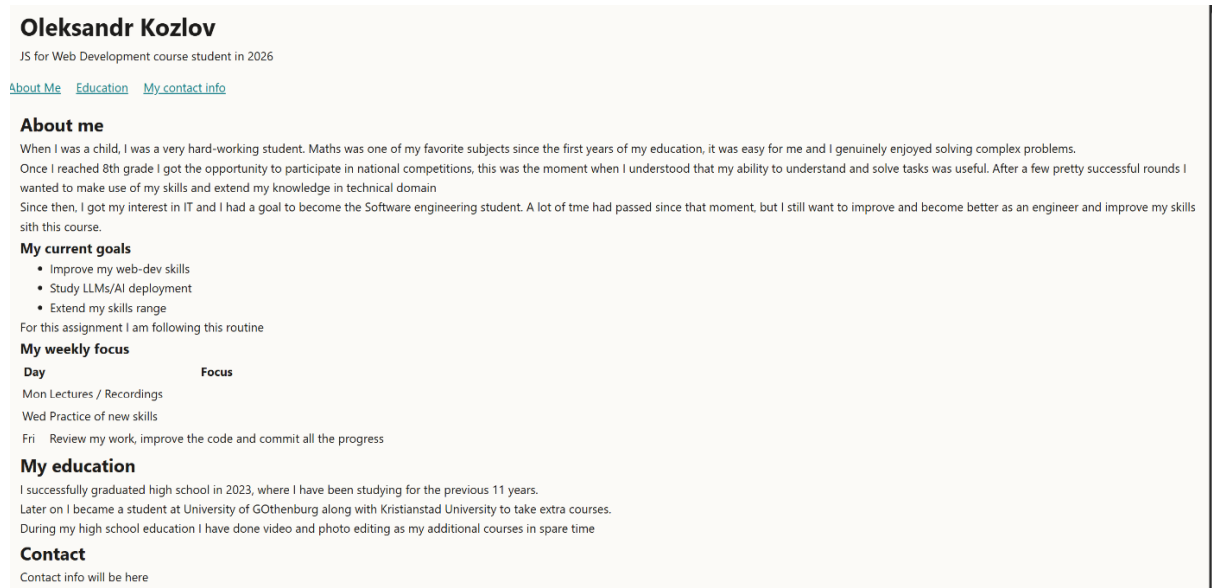

This portfolio is part of lab 1 assignment for this course, made to test my ability to create basic website using html and css. I wanted to start with grade 3 requirements and improve the product to grade 4 and 5, however I have not received my seed even at the 21st of September, so I decided to stay with the most basic grade 3 requirements.

The plan was to create a skeleton with placeholders that would match the basic structure of a web page and fill it during a few coding sessions showing the screenshots and logs of the development. This would help me to include all the mandatory parts of the lab at the beginning, so I could further extend them and not forget any of them. I worked in a few sessions because firstly, I have spent time going through the lectures and building a general understanding of new concepts and refreshing my knowledge. Later I divided the lab into 3 parts and the cycle looked like plan-read-implement-review for each of my sessions.

The css skeleton was made for the grade 4/5 template, however due to reasons mentioned above I have decided to simplify it and keep it the way it is now.

The second design change was the contact form placeholder. It was too short and did not include correct actions and fields, so I went through the lecture slides and found some information online and accomplished the desired look and usability.

2. 3 Technical difficulties

I did not encounter major technical challenges, however I would mention a few minor ones:

Aligning table was the latest thing that I have completed. At first it had no borders and columns together with rows were not aligned properly, because finding correct css properties was a bit tough. I used border-collapse and td,th border with padding to solve this issue.

Here is the screenshot of unaligned table, the columns and rows are not aligned and there was no border, now it looks as a complete, correct table and fits the requirements. Now I understand how to properly align the table into a proper grid.

Day	Focus
Mon	Lectures / Recordings
Wed	Practice of new skills
Fri	Review my work, improve the code and commit all the progress

The second issue was the contact form. My first contact placeholder was very simple and did not have the required feature for the assignment requirements, so when doing this part of the lab, I changed the action to mailto:, the enctype to text/plain and added label for to inputs. By doing this I know how HTML forms are created and submitted.

The smallest issue was regarding the place, where the content would benefit from being in a table. I spent some time thinking about the place where it would not be forced and came up with an idea to list my weekly plans as a table. I think it is the better way of displaying the information which is divided into categories.

3. Reflection

There are many different ways of achieving the desired look for the website, and the thing that was unexpected for me was the ability to use just a single parameter instead of a group of others, such as border collapse. I'd say that finding exact css properties that were needed was the most time-consuming process of the whole lab. I think it would be much faster and simpler, as long as I keep practicing, because I would remember them and use them more efficiently.

The final portfolio is different to my initial idea by not achieving grade 4/5 results and settling on grade 3. I'm going to optimize my planning and improve the result for the next lab.
